

Backyard Brew: Start Here

Everything for the bar's social media and online presence. Written so anyone can pick it up without asking Micah.

There are four sheets. This one is the map.

Sheet	When you need it
1-START-HERE	This page. What everything is
2-MAKE-A-GRAPHIC	Making a poster or promo image
3-EVERY-DAY	The daily routine. Stories, groups, comments
4-EVERY-WEEK	Sunday. Writing the whole week of posts

First time on this Mac only

Skip this if the **backyard-brew-social** folder is already on the computer.

You need the folder before you can open it. Let Claude fetch it:

1. Open the Claude app, click the **Code** tab
2. Choose **Local**, click **Select folder**, and pick your **home folder** (the one with your name on it)
3. Paste this into the message box:

Clone <https://github.com/micahh3n/backyard-brew-social> into this folder, then run `bash setup.sh` inside it.

4. Accept when it asks permission
5. When it finishes, click **Select folder** again and choose the new **backyard-brew-social** folder

Done once, never again.

Do not skip the `setup.sh` part. iPhone photos are HEIC files, and without that step nothing on the computer can read them, so `/photos` will not be able to see what your pictures are. It also adds the PDF builder and the backup poster maker.

Opening it

Everything happens in the **Claude app**. No Terminal, ever.

1. Open the Claude app
2. Click the **Code** tab at the top

3. Choose **Local**, click **Select folder**, pick the **backyard-brew-social** folder
4. Type `/` in the message box

That is it. After the first time, the folder is already in the sidebar, so you just click it.

The six commands

Type `/` and a menu appears. Six commands do the work:

Type this	What happens
<code>/sunday</code>	Writes all 21 posts for the week, plus a Google Business post
<code>/photos</code>	Looks at your new photos and names them for you
<code>/graphic</code>	Writes the Gemini prompt for a poster, then the captions
<code>/reply</code>	Turns a review or comment into a professional response
<code>/sync</code>	Gets Micah's latest changes and sends yours to him
<code>/growth-week</code>	Asks how last week went, then gives you a short list of what to do next

You do not have to use the commands. Plain English works too. "Write me a post for Friday" does the same thing as `/sunday` for one day.

It already knows the bar

You do not need to explain anything. It knows the hours, the events, the prices, the memberships, the colors, the fonts, how the bar sounds, which nights are slow, who works there, and what the goals are.

So you can just ask:

What are some good events that would bring people in on a Sunday?

Why do you think Tuesdays aren't busier?

Someone asked in a comment if dogs are allowed. What do I say?

Write something for the disc golf course for tomorrow.

If it ever gets a fact wrong, tell it. Then tell Micah so the file gets fixed for next time.

Where things live

Everything is in the `backyard-brew-social` folder.

Folder	What's in it
playbook/	These four sheets
photos/	Photos you drop in for posts
assets/logo/	The logo files
recurring_events.csv	The weekly schedule. Edit when events change
posts.csv	One-off events. Add a row for a party or holiday

Do not open the playbook sheets in TextEdit. They will look like a wall of plain text with symbols everywhere, because that version is written for Claude to read, not for you.

To read one, open the PDF in `playbook/pdf/`. To type into one, open the Word version in `playbook/editable/` with **Pages**. See the section at the bottom of this sheet.

The `.csv` files are the exception. Those are spreadsheets, so open them in **Numbers**, which is also already on the Mac.

Dropping in photos

Dump them straight off your phone into `photos/`. Do not rename anything.

Then type `/photos`. Claude opens each one, sees what is actually in it, and names them all properly. It shows you the list first and waits for you to say yes. It also skips blurry shots and near-duplicates.

That is the whole job. If you ever want to name one yourself, the pattern is `2026-09-14_bingo.jpg`, and the event keywords are `bingo`, `pickleball`, `poker`, `market`, `karaoke`, `pool`.

Sharing with Micah

Both computers use the same folder through GitHub. Type `/sync` to send your photos and changes to him and pull down anything he sent you.

Worth doing after adding photos, and any time something feels out of date.

The weekly rhythm

Sunday, about an hour. Run `/sunday`, get all 21 posts, schedule them in Meta Business Suite for the week. Sheet 4.

Every day, about 15 minutes. Stories, share the 11am post to Facebook groups, answer comments. Sheet 3.

As needed. Make a graphic (sheet 2), reply to a review (`/reply`).

Whenever you want a plan. Run `/growth-week`.

Three rules

1. **Nothing posts by itself.** Claude writes it, you post it. Nothing goes out without a person choosing to send it.
2. **Wisconsin only.** Never mention a beer, brand, or product that is not made in Wisconsin. This is the one rule with no exceptions.
3. **Look at it before you post it.** Especially graphics. Check the spelling, check nothing looks warped, check it sounds like us.

Two things about the app

It asks permission before doing things. The first few times, Claude will ask before editing a file or running something. Click Accept. If the asking gets old, change the mode next to the message box from **Manual** to **Accept edits**.

Stay in one session for the weekly work. Clicking **+ New session** starts an isolated copy of the folder, which may not include photos you just added. Use the session already sitting in the sidebar.

Reading, printing, and editing these sheets

Every sheet comes in three forms, all in the `playbook` folder:

Folder	What it is	Open it with
<code>pdf/</code>	For reading and printing	Preview. Just double-click
<code>editable/</code>	Word documents you can type into	Pages , already on the Mac
the <code>.md</code> files	What Claude reads	Nothing. Leave these alone

First time opening one from `editable/`: double-click it. If it opens in TextEdit and looks wrong, right-click the file → **Open With** → **Pages**, then check **Always Open With** so it remembers.

You do not need Microsoft Word. Pages is free, already installed, and opens these fine. If you happen to have Word already, that works too. Either way, print straight from the app when you are done.

To change something, the easy way is to just ask Claude:

Add these Facebook groups to the daily sheet: [names]

Change the story minimum from 2 to 3

It updates the sheet and rebuilds the PDF and the Word version together, so all three stay matched.

To type into it yourself, open the file in `editable/` with Pages. Fill in the Facebook groups table, cross things out, add notes. Print from Pages when you are done.

One catch: edits made in Pages live only in that Word file. Claude will not know about them. Anything that should stick permanently is better done by asking Claude.

If something is not working

Ask Claude. Describe what happened in plain words:

The /sunday command isn't showing up when I type slash

It wrote a caption mentioning a beer we don't carry

The PDFs won't rebuild

It can read its own setup and fix most things. If it cannot, text Micah.
